I .Q: Purpose of atomic documentation The C99 standard specifies that the atomic builtins `__atomic_*` functions are non-reentrant. However, the use of this restriction is not necessary clear. I have been asked to document the use of these functions, which I find unnecessarily awkward. Does anyone know of a good example of a function that uses atomic builtins? A: The point is that the notion of "atomic" is "locked" by the compiler when it stores the value into memory. Consider this (illustrative) code fragment: `{ int32_t a = 0; (void)atomic_load_acquire(&a); atomic_store_release(&a, 1); }` The compiler has no choice but to take the "int32_t" argument and convert it into a memory address (or pointer to memory address), so the compiler has to ensure that: Both read and write operations "obtain a snapshot" (the seemingly-controversial term I'm using is more precise than "atomic") of the memory it will store the value in. Note the compiler can't trust the user of the library and the compiler 6d1f23a050
